

Venue Player Manager

Summary

Venue Player Manager is a browser based control, status and set up solution provided with all Venue Player software. The Manager is providing an easy to use interface accessible from any network attached to the player system itself which publishes the browser pages outlined below. With this interface each video channel output can be individually accessed with commands applied in any timing or order completely independent of other outputs on one or more systems being controlled.

Control

Venue Player Manager control applies standard video playback controls to one or more player systems. Each unit and player output is able to be controlled independently or locked for playback together:

- Player controls include go to first/last frame, jog back or forward, pause, play
- Speed of playback is selectable in increments of percentage of play speed down to single frame per second and up to 2X.
- Map sequence selects the video for each selected player output
- Adding a library is a function for organizing playback files into user named file folders accessible by ClearView applications for file importing and recording
- Seek to frame is most times used to play a frame based test pattern
- Play or cue and timecode value is selectable via time code entry

Unit Status

The Venue Player Manager allows operators to understand the settings of each player unit and the diagnostic parameters of several internal components such as CPU and system temperature as well as video interface output board temperatures.

Player Status

Player video outputs are controllable with any command at any time individually. Player status provides a view of each video's library, sequence name, video format and image format. Additional parameters applied are shown below.

Manager Admin

The administration page is providing control settings and management of parameter settings for each player unit and each channel of video. Settings for the following apply in the Action drop down in the window below.

- Cue selected players
- Enable or disable audio playback, play once, previews or two sample interleave mode (TSI) for 4K formats
- Lock selected players together, or lock to external or internal reference
- Monitor, reboot or remove selected players
- Shutdown, unlock, unmonitor or update selected players
- Set module index allows the external or internal reference setting to apply to one or two different video modules
